New Construction of Northview Midrise

ADDENDUM NO. 1

This addendum issued April 19, 2022 becomes in its entirety a part of the Invitation for Bid IFB#2022-37 as is fully set forth herein:

Item 1: **Q:** Will the HACP update the Fire Alarm Section 283111 to allow other manufactures other than Simplex or Siemens?

A: Fire Alarm General notes on drawing FA300, Note 1 - System is Siemen's or approved equal. In "Part 2, 2.1, A, 3 Manufacturers" of the specifications, please replace "Substitutions: not Permitted" with "Substitutions by approved equal". Please see Attachment A for the updated page 7 of the Specifications Section 283111 along with the entire Specifications Section 283111.

Item 2: **Q:** The scopes prior to the different bid forms appear to be vague. Will a multiple contract summary properly defining the scopes be forthcoming?

A: Yes, a multiple contract summary will be issued as a part of a forthcoming addendum.

Item 3: **Q:** The timeframe between bidding and start of construction is approximately 6 months. Current pricing is extremely volatile. In addition, vendors will not hold product nor pricing this long. There is no way to properly gauge potential price increases, due to the supply chain issues being unprecedented. How shall we handle price increases from bid due date to start of construction?

A: Should the market for materials change between the issuance of a Notice to Award letter and execution of a construction contract, the awarded offeror(s) will have the opportunity to provide documented evidence of any price fluctuations. Any increase in costs submitted by the awarded offeror(s) must be evidenced by sufficient documentation to verify and justify any changes to the bid amount. The increased costs or

escalation requests will be compared to escalation increases in materials based upon RS Means, considering prices of materials at time of bid and time of starting work. The lesser of the two (contractors proposed escalation vs RS Means escalation) will be considered. A decision to accept the proposed changes to any bid amounts after the Notice to Award will be at the sole discretion of Allies & Ross Management and Development Corporation. No increases to labor costs will be accepted only if required by the U. S. Department of Labor via the issuance of an updated Federal Davis-Bacon wage determination.

Item 4: **Q**: The plumbing piping material schedule on drawing P501 differs from the Division 22 specifications. Which should we follow?

A: Please follow the plumbing piping material schedule on drawing P501. Please refer to Attachment B, "Sheet No. P501".

Item 5: **Q:** Should the plumbing piping material schedule on drawing P501 is what we are to follow, should the underground storm and underground sanitary be schedule 80 as listed, or schedule 40 per industry standard?

A: The underground storm and underground sanitary should be Schedule 40. Please refer to Attachment B, "Sheet No. P501".

Item 6: **Q:** Is the PEX tubing to be insulated?

A: Yes, the PEX tubing is to be insulated for both the hot and the cold water lines. Please refer to Attachment C, "Section 220719 – Plumbing Piping Insulation".

Item 7: **Q:** If a prime contractor is an MBE or WBE certified company, would the percentage of participation for their respective certification be 100%, with no other participation required (100% MBE and 0% WBE / 100% WBE and 0% MBE)?

A: If a prime contractor is the MBE they will still need to reach out to 10 certified WBEs in writing. If the prime contractor is a WBE on a contract they will need to reach out to 10 certified MBEs in writing. The prime will also need to submit a certificate for the specific MBE or WBE from a 3rd party vendor. ARMDC does not accept self-certifications.

Item 8: **Please see Attachment D, "Form of Bid 00311-1r1". This form replaces "Form of Bid 00311-1", and offerors responding to the General Construction portion of the Invitation for Bid must complete this revised attached form.**

2. BOCA Building Code.
3. National Electric Code.

1.3 SYSTEM DESCRIPTION

A. Fire Alarm System: NFPA 72, manual and automatic local fire alarm system with connections to an approved monitoring station.

B. Provide a complete Fire Alarm System as described herein and as shown on the plans; to be wired, connected, and left in an operating condition. The system shall use analog addressable initiating device circuits with individual device supervision, individual notification appliance circuit supervision, incoming, and standby power supervision. Include control panels, power supplies, remote annunciators, manual pull stations, addressable interfaces to sprinkler system devices furnished by others (if applicable), and kitchen suppression systems furnished by others (if applicable), Speakers, horns, strobes, remote control devices, wiring, connections to devices, outlet boxes, junction boxes, and all other necessary material for a complete operating system.

C. The fire alarm control panel shall allow for loading or editing special instructions and operating sequences as required. The system is to be capable of on-site programming to accommodate expansion, building parameter changes or changes as required by local codes. All software operations are to be stored in a non-volatile programmable memory within the fire alarm control panel. Loss of primary and secondary power shall not erase the instructions stored in memory.

D. All panels and peripheral devices shall be the standard product of a single manufacturer and shall display the manufacturer's name on each component. The catalog numbers specified under this section are those of Simplex constitute the material and desired operating features to be furnished.

1.4 OPERATION

A. Under normal condition, the front panel shall display a "SYSTEM NORMAL" message

and the current time and date.

B. Should an abnormal condition be detected, the appropriate LED (“Fire Alarm”, “System Supervisory”, or “System Trouble”) shall flash. The panel audible signal shall pulse for alarm conditions and sound steadily for trouble and supervisory conditions.

C. The panel shall have an eighty (80) character LCD display. The following information relative to the abnormal condition of a point in the system shall be displayed:

1. Custom location label describing the exact location of the device to include floor, room number (or nearest room number for corridor mounted devices). No two devices shall have the same location label. Provide forty (40) characters minimum to describe location information, this is in addition to the "type of device" and "status" requirements listed below.

A. The custom location label of each device shall be capable of being edited by the owner from the front panel controls. An off board programmer and or/computer shall not be required for the owner to change this information.

2. Types of device (i.e. smoke, pull station, waterflow). Provide twenty (20) characters minimum to describe device type information.

3. Point status (i.e. alarm, trouble, sprinkler supervisory). Provide twenty (20) characters minimum to describe point status.

D. Pressing the appropriate acknowledge button shall acknowledge the alarm or trouble condition. (The acknowledge, reset and bypass functions shall be pass-code protected. Three levels of pass-code protection shall be provided). If the user has insufficient privilege to acknowledge such conditions, a message shall indicate insufficient privilege but allow the user to view the points without acknowledging them. Should the user have sufficient privilege to acknowledge, a message will be displayed informing the user that the condition has been acknowledged.

E. Alarm Silencing

1. Should the "Alarm Silence" button be pressed, all audible notification appliances shall be deactivated. Visual indicating appliances shall continue to flash until the system is reset.

A. A dedicated “Alarm Silenced” LED indicator located on the front panel display shall be illuminated.

B. Should another alarm be reported, the audible notification appliances shall re-sound and the “Alarm Silenced” LED shall be extinguished until deactivated by the “Alarm Silence” button as described above.

F. System Reset

1. The "System Reset" button shall be used to return the system to its normal state after an alarm condition has been remedied. The display shall step the user through the reset process with simple English language messages. Messages shall provide operator assurance of the sequential steps (i.e.: "IN PROGRESS", "RESET COMPLETED", and "SYSTEM NORMAL") as they occur, should all alarm conditions be cleared.

2. Should an alarm condition continue to exist, the system will remain in an abnormal state. System control relays shall not reset. The panel audible signal and the Alarm LED shall be on. The display will indicate the total number of alarms and troubles present in the system along with a prompting to review the points. These points will not require acknowledgment if they were previously acknowledged.

G. History Logging

1. In order to recreate a sequence of events in a fire or trouble investigation, the control panel shall store system abnormal conditions in three separate logs. Alarm activities shall be stored in an “Alarm Log”, sprinkler supervisory (tamper switch) activation in a “Supervisory Log”, and trouble events in a “Trouble Log”. The time and date of each occurrence must be included with each entry. These events shall be stored in a battery protected random access memory (RAM). In order to prevent re-occurring trouble and/or sprinkler supervisory conditions from overwriting other information, it is mandatory that each type of event be stored separately. Systems that are not equipped with separate logs, as described, shall include a UL listed fire alarm printer with battery back-up to record system activity including time and date of each occurrence.

H. Walk Test with History Logging

1. The system shall be capable of being tested by one person. While in testing mode, the alarm activation of an initiating device shall cause the system audible indicating devices to sound to in a coded pattern that uniquely identifies the initiating device that is activated. The panel shall then automatically reset itself after logging of the alarm.

2. The momentary disconnection of an initiating device, notification appliance, or the grounded condition of any circuit shall cause the system audible indicating appliances to sound for four (4) seconds. The panel shall automatically reset itself after logging of the trouble condition.

3. Should the walk test feature of the system be activated for eight (8) hours without testing activity, the system shall revert to the normal mode of operation automatically.

I. System Trouble Reminder

1. Should a trouble condition be present within the system and the audible trouble signal silenced, the trouble signal shall resound at eight (8) hour time intervals to act as a reminder to the owner that the fire alarm system is not 100% operational.

J. Smoke Sensor Operation

1. The smoke sensors shall automatically meet NFPA sensitivity testing requirements.

A. The control panel shall be listed as a calibrated sensitivity testing instrument that will automatically meet NFPA 72E Sensitivity Testing Requirements. The requirement to test the sensitivity of each detector within one year of installation and every alternate year thereafter as described in NFPA 72E shall not need to be performed manually.

2. The smoke sensors shall be smoke density measuring devices having no self contained alarm set-point. The alarm decision for each sensor shall be determined by the control panel. The control panel shall determine the condition of each sensor by comparing the sensor value to stored values.

3. The control panel shall maintain a moving average of the sensors smoke chamber value. The system shall automatically maintain a constant smoke obscuration sensitivity for each sensor and compensate for environmental factors such as dust accumulation.

4. The system shall automatically indicate when an individual sensor needs cleaning. When a sensor's average value reaches a predetermined value, a "Dirty Sensor" trouble condition shall be audibly and visually indicated at the control panel for the individual sensor. Additionally, the LED on the sensor base shall glow steady giving a visual indication at the sensor location.

   A. The smoke sensor shall not be operating at an increased sensitivity level due to the dust/dirt contamination. It shall continue to operate at the pre-set sensitivity level.

   B. Maintenance personnel shall be able to get a report of sensors that are “Almost Dirty” from the control panel display so that these sensors can be serviced while maintenance on the dirty sensors is being performed.

5. The control panel shall have the capability of being programmed for a pre-alarm or two-stage function. This function shall allow a "pre-alarm" indication to occur when, for example, a 3% sensor reaches a threshold of 1.5% smoke obscuration.

6. The control panel shall log the peak smoke obscuration level (for smoke sensors) or temperature (for heat sensors) at each device location. This shall enable an operator to set the sensitivity of individual sensors slightly above the normal environmental conditions in order to optimize the performance and reduce nuisance alarms within the system.

7. The device addressing mechanism shall permit the user to replace faulty sensors with spare units without the need for an electronic programming machine.

K. Notification Appliance Operation

1. The system shall provide for the synchronization and control of the audible and visible notification appliances on a common 2-wire circuit. Visual and audible signals shall be synchronized across all notification appliance circuits in the system. The audible notification signal shall be in a temporal code pattern as described by NFPA 72 and shall remain active until the “Alarm Silence” switch is activated at the fire alarm control panel (or at the remote annunciator panel). The visible notification appliances (xenon strobes) shall be synchronized and shall remain active until the system is reset.

1.5 ALARM SEQUENCE

A. The system alarm operation subsequent to the alarm activation of any manual station or automatic detection device is to be as follows:

1. All audible alarm notification appliances shall sound a temporal code pattern (.5 sec. on, .5 sec. off, .5 sec. on, .5 sec. off, .5 sec. on, 2.5 sec. off, then repeat) until silenced by the alarm silence switch at the control panel or at the remote

annunciator panel.

2. All visible alarm notification appliances, Xenon Strobes, shall display a continuous pattern until the system is reset.

3. All doors normally held open by door control devices shall release.

4. The alarm signal shall be reported an off site monitoring facility. The digital communicator furnished with this project shall be programmed to report to the owners selected monitoring company.

5. The alarm is to be recorded with the time and date in the system's alarm log.

B. The alarm activation of any elevator lobby smoke detector shall, in addition to the operations listed above, cause the elevator cabs to be recalled according to the following sequence:

1. If the alarmed detector is on any floor other than the main level of egress, the elevator cabs shall be recalled to the main level of egress.

2. If the alarmed detector is on the main egress level, the elevator cabs shall be recalled to the predetermined alternate recall level as determined by the local authority having jurisdiction.

1.6 SUPERVISION

A. The disarrangement condition of any circuit shall not disrupt the operation of any other circuit.

B. Each addressable initiating device and independently supervised circuit shall include a discrete panel readout to indicate disarrangement conditions.

C. The incoming power to the system shall be supervised so that any power failure must be audibly and visibly indicated at the control panel. A green "power on" LED shall be displayed continuously while incoming power is present.

D. The system batteries shall be supervised so that a low battery condition or disconnection of the battery shall be audibly and visibly indicated at the control panel and remote annunciator.

E. The system shall provide for an operator to disable and enable each addressable device, indicating appliance circuit and each relay control circuit individually for maintenance or testing purposes.

F. If any addressable device is removed a "Device Missing" message along with the exact location of the missing device must be indicated at the fire alarm control panel and at the remote annunciator panel along with a system trouble indication.

G. If more than one addressable initiating device is inadvertently programmed with the same address, a “Duplicate Address” error shall be displayed on the control panel operator’s display.

1.7 POWER REQUIREMENTS

A. The control panel shall receive 120 VAC power (as noted on the plans) via a dedicated circuit.

B. The control panel shall contain four Notification Appliance Circuits for alarm Speakers and strobes as a minimum. Notification Appliance Circuit Extender Panels shall be furnished and installed as required to operate all notification appliances shown on the plans, or as required to meet the device power requirements, with 35% spare capacity per circuit for future additions.

C. The system shall be provided with sufficient battery capacity to operate the entire system upon loss of normal 120 VAC power in a normal supervisory mode for a period of sixty (60) hours with five (5) minutes of alarm operation at the end of this period. The system shall automatically transfer to the standby batteries upon power failure. All battery charging and recharging operations shall be automatic. SEQUENCE OF OPERATION:

AHU(s) & HP(s) - VARIABLE REFRIGERANT FLOW SYSTEM

THE FOLLOWING SEQUENCE OF OPERATION SHALL BE PROVIDED:

UNOCCUPIED MODE:

THE OUTDOOR AIR DAMPER SHALL BE FULLY CLOSED. THE HEAT PUMP HEATING SHALL MAINTAIN A MINIMUM TEMPERATURE OF 60 DEGREES F. THE DX COOLING SHALL MAINTAIN A MAXIMUM TEMPERATURE OF 80 DEGREES. THE SUPPLY FAN SHALL OPERATE INTERMITTENTLY AS NECESSARY TO MAINTAIN SPACE TEMPERATURE.

OCCUPIED MODE:

THE OUTDOOR AIR DAMPER SHALL BE FULLY OPEN. SPACE TEMPERATURE SHALL BE MAINTAINED VIA A PROGRAMMABLE 7-DAY THERMOSTAT (ONE PER INDOOR UNIT). THE THERMOSTAT SHALL BE SET TO MAINTAIN 74 DEGREES IN THE COOLING MODE AND 72 DEGREES IN THE HEATING MODE. AS THE SPACE TEMPERATURE RISES ABOVE THE TEMPERATURE SETPOINT, THE THERMOSTAT SHALL SEND THE SPLIT SYSTEM INTO COOLING MODE. AS THE SPACE TEMPERATURE FALLS BELOW SPACE TEMPERATURE THE COOLING MODE SHALL BE DE-ENERGIZED. IF THE SPACE TEMPERATURE CONTINUES TO FALL BELOW THE HEATING MINIMUM SETPOINT, THE THERMOSTAT SHALL SEND THE SPLIT SYSTEM INTO HEATING MODE.

THE SUPPLY FAN SHALL OPERATE INTERMITTENTLY AS NECESSARY TO MAINTAIN SPACE TEMPERATURE.

UNIT TO SHUTDOWN UPON SENSING WATER IN SECONDARY CONTAINMENT PAN. PROVIDE ALARM AT 7-DAY PROGRAMMABLE THERMOSTAT.

APARTMENT BATHROOM EXHAUST FAN (CEF-1)

EXHAUST FAN SHALL BE CONTROLLED VIA A BROAN SMART SWITCH.

WHEN THE EXHAUST FAN IS IN THE OCCUPIED MODE, THE FAN SHALL BE ENERGIZED. WHEN THE EXHAUST FAN IS IN THE UNOCCUPIED MODE, THE FAN SHALL BE DE-ENERGIZED.

BUILDING BATHROOM EXHAUST FAN (CEF-2, CEF-3, CEF-4)

EXHAUST FANS SHALL BE CONTROLLED TO OPERATE WHEN THE BATHROOM IS OCCUPIED.

WHEN THE EXHAUST FAN IS IN THE OCCUPIED MODE, THE FAN SHALL BE ENERGIZED. WHEN THE EXHAUST FAN IS IN THE UNOCCUPIED MODE, THE FAN SHALL BE DE-ENERGIZED.

TRASH ROOM EXHAUST FANS (CEF-5, CEF-6, CEF-7, CEF-8, CEF-9)

EXHAUST FANS SHALL OPERATE VIA A CYCLE TIMER TO OPERATE 30 MINUTES OUT OF EVERY HOUR.

2 WATER UTILITY ROOM EXHAUST FAN (EF-1)

EXHAUST FAN SHALL OPERATE CONTINUOUSLY DURING THE SUMMER MONTHS AND DE-ENERGIZED THE REMAINED OF THE YEAR.

EXHAUST FAN SHALL BE INTERLOCKED WITH THE INTAKE AND EXHAUST MOTORIZED DAMPERS. WHEN THE EXHAUST FAN IS ENERGIZED THE MOTORIZED DAMPERS SHALL OPEN. WHEN THE EXHAUST FAN IS DE-ENERGIZED THE MOTORIZED DAMPERS SHALL CLOSE.

ELECTRIC HEATERS

UNITS SHALL OPERATE VIA THEIR FACTORY-PROVIDED THERMOSTATS TO MAINTAIN 65°F (ADJUSTABLE).
